Volume XLI – Number 5

Issued Monthly

May 24, 2021

HONEY MARKET FOR THE MONTH OF APRIL 2021

IN VOLUMES OF 10,000 POUNDS OR GREATER UNLESS OTHERWISE STATED

Prices paid to beekeepers for extracted, unprocessed honey in major producing states by packers, handlers & other large users, cents per pound, f.o.b. or delivered nearby, containers exchanged or returned, prompt delivery & payment unless otherwise stated.

- REPORT INCLUDES BOTH NEW AND OLD CROP HONEY - (# Some in Small Lot --- +Some delayed payments or previous commitment)

CALIFORNIA

Buckwheat	Amber	\$2.08	
Mixed Flower	Light Amber	\$2.10	
Sage	Amber	\$2.08	

DAKOTAS

Buckwheat	Light Amber	\$1.50	
Clover	White	\$1.55	- \$1.80
Clover	Extra Light Amber	\$1.80

COLONY, HONEY PLANT AND MARKET CONDITIONS DURING APRIL 2021

APPALACHIAN DISTRICT (MD, PA, VA, WV): Spring arrived in the District with the normal roller coaster weather changes. The first of the month produced a Mother Nature reality check with dipping temperatures to the mid-twenties across the District with daytime highs in the forties. A few days later lows were in the upper thirties and with daytime highs in the seventies. By mid-month the daytime temperatures fell back to the upper fifties and sixties. As the month progressed, another dip into freezing temperatures occurred the final weekend with highs in the mid-sixties. While causing some damage to heavy budded orchards, bees were very active during the warmer periods. Packaged bee orders were distributed to their new owners. Beekeepers reported some swarming, packed nectar, and plenty of brood rearing activity. Colonies that survived the winter were in overall good health

with an occasional report of mites. Pollen sources are numerous and prolific this time of year starting with orchards (peaches, nectarines, and various variety of apples), strawberries, redbuds, crabapples, dandelions, and various spring ephemerals. The 2021 Maryland General Assembly passed the bill to fix the Pollinator Protection Act, HB208/SB375. This bill was needed because Md Dept of Agriculture was misinterpreting the Pollinator Protection Act law to allow over 100 retailers to continue to sell consumers bee-killing home & garden products containing neonicotinoids (aka neonics), even though these products were banned for consumer use after 2017. Beekeepers are hopeful that eliminating consumer use as the law intended can make a significant impact on annual bee losses.

ALABAMA: No report issued.

ARIZONA: Temperatures across Arizona were at normal levels for the month of April. The main nectar and pollen sources for bees across Arizona during the month of April were backyard and desert plant bloom and alfalfa. Arizona is also preparing for the start of melon season (cantaloupes, honeydews, watermelons, mixed melons) during the month of May.

Dry, drought like conditions continue across the state. 99.02 percent of Arizona is now under drought conditions, with 86.56 percent of the state under extreme drought conditions. Demand for honey remained good across Arizona.

ARKANSAS: During the month of April temperatures were mostly below normal across most of the state. Precipitation during April was mostly below normal across most of the state. According to the U.S. Drought Monitor website, Arkansas had normal soil moisture conditions for April. Too few prices exist to establish a current market price for wholesale white honey.

CALIFORNIA: "April was extremely cold and dry," a California beekeeper said. "The bees were confined and as a result decided that it was time to start swarming, even with the lack of a nectar flow." A few warm days got the bees excited, and then it cooled back down.

"We were able to make up our losses as queens were readily available," he said. "There is very little nectar available, and we are feeding syrup. Honey prices should be going up, but we have not heard anything yet."

Another beekeeper confirmed the drought had resulted in scarce nectar flow, except in citrus growing regions where honey was produced. "Feeding continued in many areas throughout the month," he said. "There are very few wildflowers remaining this spring as most have already dried up. Bees were removed from apple and cherry pollination in April." "Upcoming summer pollination includes alfalfa seed, melons, and other cucurbits in areas where irrigation water is available," he continued. "All areas are experiencing water cutbacks, and some irrigation districts will not deliver surface water this year. It is indeed a critical situation."

FLORIDA: Temperatures were about normal, and precipitation was just a little less than normal for the month. Bee health was considered to be about average. Gallberry, palmetto and tupelo all starting blooming around their expected bloom dates. Tupelo had finished by the end of the month. Gallberry and palmetto should continue blooming until about the middle of May. Other sources of food for the bees included black gum, privet and assorted wildflowers. Many beekeepers will treat for mites after the Gallberry and palmetto honey seasons end. Some beekeepers were reporting that tupelo honey production may have been a little better than normal. Splitting and selling hives gave some beekeepers additional income during the month. This should continue for most of the month of May. Some Florida bees were pollinating crops in Florida such as watermelons and cucumbers. Other hives were relocated to Maine and New York. Blueberries were the main crop bees were working in those states. New beekeeper registrations continue to grow in Florida. There are over 5,000 registered beekeepers in the state. Most of the new registrations are backyard or hobby beekeepers with the number of commercial beekeepers remaining fairly steady over the past few years. There was practically no stored orange blossom honey at the end of the month. There were moderate amounts of tupelo honey with some Gallberry and palmetto honey stored at the end of the month. Demand appeared to be moderate. Tupelo honey prices were not high enough to encourage some honey producers to sell.

GEORGIA: The bees were finally able to get out and about for much of April despite plenty of rain at times and cold temps. Watermelon feeding is about done and Gallberry and blackberries are still going strong along with the usual wildflowers. Beekeepers are looking for places to put hives in for a Sourwood crop later. Some areas are already checking the Spring honey flow and may start pulling honey this week if it looks good. Prices in 5-gallon buckets and barrels: Wildflower \$3-3.50 per pound and Tupelo \$4.50-6.00 per pound

IDAHO, COLORADO, UTAH: During the month of April temperatures were about normal across Eastern Idaho. Western Idaho had temperatures that were about normal for the month. Utah had temperatures that were lower than normal across most of the state. Colorado had temperatures that were lower than normal in the Eastern part of the state. The Western part saw temperatures that were a little lower than normal. Precipitation during April was below normal across most of Idaho, Utah, and Western Colorado. Eastern Colorado saw precipitation that was above normal for April. According to the U.S. Drought Monitor website, Idaho had abnormally dry to moderate drought soil conditions except for the Central area where a small area of severe to extreme drought conditions. Most of Utah is currently under extreme to exceptional drought conditions. Western Colorado had extreme to exceptionally dry soil conditions while Eastern Colorado had moderate to severe drought conditions during April.

Most Beekeepers have brought their bees back home from California from almond pollination and have been putting them around their home state or surrounding states.

Demand for Locally sourced honey has been good, and supply has been able to keep up. There were too few sales reported to establish a market for local honey.

ILLINOIS: Temperatures for the month of April started warmer, dipped colder and then ended within the average and with very little rainfall. Beekeepers report that their bees are in good condition. Beekeepers report that the following foliage is in bloom: Pussy willow, soft maple as sources of pollen; maples, and a little dandelion for nectar. Demand for honey is very good at the retail level and good at wholesale level. Prices are generally unchanged.

INDIANA: Temperatures for the month of April fluctuated from cold to warm to cold and then back to warm by the month. Rainfall in most parts of the state was much lower than average for this time of the year. Beekeepers report that maple and willow are in bloom. Most Beekeepers report a normal, healthy population of bees, while others say they are starting over with new packages Demand for honey is good at the retail level and fairly good at the wholesale level. Prices are generally unchanged.

IOWA, KANSAS, MISSOURI, NEBRASKA: No report issued.

KENTUCKY: Dr Tammy Potter, Kentucky State Apiarist, Kentucky Department of Agriculture, reported, "Snow in April is abominable," wrote writer L.M. Montgomery. "Like a slap in the face when you expected a kiss." On April 21, Kentucky beekeepers awoke to snow on their hives, the latest date for snow ever recorded in Kentucky, after a relatively warm and sunny three weeks. For some hives, the snow indeed was a death blow, as I began receiving pictures of small clusters of honey bees, only their tails visible from the cells, indicating the hive died due to lack of honey and/or population (a "hotel with too few staff"). Some beekeepers have had high hive losses (one beekeeper had 500 hives die) due to viruses in the hives, such as chronic bee paralysis. In my hive inspections, I have also seen several cases of European foulbrood in individual hives (not apiary-wide). Depending on the situation, the beekeeper was able to control the disease with requeening and/or a VFD. Temperatures quickly rebounded after April 21, and honeybees were actively working wild cherry, black locust, canola in the western part of the state, Greater waterleaf, autumn olive in the eastern part of the state, spring beauty, ragworts, and tulip poplar. The pandemic still tends to hover over any discussions about when to have beekeeping education events, and many events that had been planned tentatively earlier in the year were cancelled or deferred until later this year. There is good news, though, as Kentuckians are being vaccinated in all age-categories and inching ever-closer to Gov. Beshear's goal of 2.5 million vaccinated citizens. The Governor has begun lifting event restrictions so that events with less than 1,000 people may occur if social distance protocols are followed. Other pandemic-related consequences such as the high price of lumber have led many beekeepers to consider switching to polystyrene hives, which are lighter and about the same cost if one considers the labor necessary to either build equipment or buy woodenware.

LOUISIANA: During the month of April temperatures were below normal across most of the state. Precipitation was normal in the Northern part of the state and well above normal across the Southern part of the state. According to the U.S. Drought Monitor website, Louisiana had mostly normal soil moisture conditions for April. Too few prices exist to establish a current market price for wholesale white honey.

MICHIGAN: April has been quite warm most of the month with early morning freezes during the last week. Some damage to fruit blooms occurred on early blooming trees.

The hives are building nicely as queens expand their brood nest. Lots of early blooming plants with lots of pollen and some nectar. Plants blooming were dandelion Red Maples, Sugar Maples, Pussy Willows, Weeping Willows, Crocus, Grape Hyacinth, Daffodil, and Violets. Most of the nectar collected was used in the brood nest.

Some early swarming has occurred on the stronger hives. Beekeepers have started doing splits in stronger hives to reduce the chances of swarming. Packaged bees were hived as the active session started this month. Local honey sales continue to be good, but some beekeepers are reporting dwindling stores as the honey flows start.

MINNESOTA: During the month of April, temperatures were above normal across Northern Minnesota. Southern Minnesota had temperatures that were below normal for the month of April. Precipitation in April was above normal across the state. According to the U.S. Drought Monitor website, Minnesota had normal to moderate soil moisture conditions during the month of April.

The 2021 almond pollination has started coming to a close and beekeepers have been bringing their bees home. Demand for Minnesota honey continues to be good for locally sourced honey. There were too few sales reported to establish a market for local honey.

MISSISSIPPI: Beekeepers are switching Nucs into big boxes and splitting Supers to keep up with sales and replacing any lost hives over the winter. Privet hedge, White Dutch Clover and Wildflowers are the main sources of feed and so far the honey flow looks like it will be a good one. There has been a lot of rain so that could hamper volume and quality if it continues. Most areas report no major damages from previous weather earlier in the month, such as wind, hail and tornadoes.

MONTANA: As the last week of April ended, cooler temperatures and little precipitation were recorded across Montana for much of the month of April. According to the U.S. Drought Monitor, approximately 89 percent of Montana is abnormally dry or in a state of drought. Topsoil moisture measurements for April measured 31 percent very short, compared to 2 percent last year; 28 percent short, compared to 12 percent last year; 39 percent adequate, while 81 percent last year; and 2 percent surplus, compared to 5 percent last year. Subsoil moisture measured 66 percent short and very short, while 34 percent of the subsoil moisture measurements were adequate or surplus.

Many Montana colonies were traveling in Oregon or Washington State during April. Tree fruit pollination was occurring in generally good pollination weather, although soil conditions were generally dry with several early morning's freezes. Wind conditions also were rather breezy many times during the month. Berry pollination season as continuing as April ended. The main nectar and pollen sources for bees across Montana were backyard and native plant bloom.

According to figures from the National Agricultural Statistical Service (NASS), for 2020, Montana had 110,000 honey producing colonies (down from 173,000 colonies in 2019), 8,910,000 pounds of honey were produced in 2020, down from the 14,878,000 pounds produced in 2019, with a total production value of \$13,989,000 in 2020, a decrease from the \$22,168,000 earned in 2019. The average per pound price for honey in Montana in 2020 was \$1.57, up from the 2019 average of \$1.49 per pound.

NEW ENGLAND: Spring in New England is here, and, with it, we begin another full season of beekeeping. Despite the pandemic, several clubs have provided new beekeepers with the education that they seek, moving classes to Zoom. Let's hope that at least 80% of the general population will be vaccinated as early as possible and that we can move to in-person education classes and meetings. In New England this is the time of year when beekeepers start to see hive activity, assuming the hive did not die overwinter. As the daily temperature rises, beekeepers are all ready to dig into the hive to see new brood, find the queen and prepare for the nectar flow. Dead hives remind us that the fight against mites is an ongoing battle, which is why experienced beekeepers prefer swarms to packaged bees – swarms are survivor bees and may have better genetics in the varroa destructor war.

New England weather for the month of April has been in drought style conditions and cooler with unstable temperatures and a mixture of some mild to warm days sporadically placed along the month. This year's spring will soon be flourishing with the normal ornamental and floral sources for pollen and nectar such as quaking aspen, alder, spice bush, sassafras, leather leaf, pin cherry, blueberry, and many varieties of apple bloom especially crab apple. The Easter and Passover Holidays are over, which brings on the usual advent of regional pollen and nectar sources such as ground ivy (glechoma hederacea), chickweed (stellaria media), snow drop (chionodoxa luciliae), Siberian squill (scilla Siberica), American elm (Ulmus Americana), jasmine, witch hazel, dandelions and willows such as goat, white, black and pussy (Salix discolor). Bees are getting pollen and nectar when they can, but it has stayed consistently cool. Bees need warmer temperatures to actively increase foraging. Cooler temperatures in higher elevations have created a problem with chill brood whereby the queen's activity has been restricted. Reportedly some keepers lost hives to a continuance of cooler weather, preventing bees

from foraging and because there were no surplus honey stores. Additionally, nectar sources have not been fully available. Hives will normally consume 1.2 lbs. of honey per day with full colonies ranging from 40,000-50,000 bees.

Northwestern New England shows mixed reports on losses of up to 40%. Surviving weak colonies have been combined and hive bodies are being rotated with most overwintered queens beginning to lay normally.

Northern keepers will keep their entrance reducers in place until the end of May as cold snaps are quite common with changing New England weather.

Reportedly all keepers are active in checking food sources weekly and are reversing hive bodies to keep the brood in the bottom and will add a super before the bees get too crowded. Beekeepers continue to administer pollen supports and supplemental feedings on a need basis and will soon make sure that syrup 1:1 is available on the hive until combs are drawn out.

Overall, in New England and especially in Massachusetts, demand for startup and replacement bees has been strong. Massachusetts State bee inspectors report up to 40% or more of hive winter losses. Keepers that have recently received package bees/nucs or are about to, are just setting up in anticipation and are hopeful for a strong summer production season. Purportedly, Prices for package bees range from \$120.00 to \$150.00 mostly \$150.00 for a 3 lb. package with queen with many regional beekeeping associations offering this price scheme lineup. Reportedly, 3 to 5 frame nuclei colonies usually develop 5 to 6 weeks ahead of package startups with less Supersedure problems due to population imbalances before new brood starts to hatch. Reportedly, packages that lose queens can develop laying workers quickly. Demand at all retail/wholesale outlets remains good and honey market prices higher. Prices quoted for retail 1 lb. bottled units were \$9.00 to \$15.00 mostly \$15.00, occasionally higher, and 1 Quart bottled units were \$18.00 to \$25.00 mostly \$25.00, occasionally higher, inclusive of all varieties; for food service operations, prices were steady with 5-gallon units at \$200.00 to \$250.00 mostly \$250.00 and occasionally lower for all raw and natural honey depending on variety and quality. Additionally, current prices quoted for 1 Quart bottled units for raw pollen were \$28.00 to \$35.00 mostly \$32.00 and for raw Propolis tincture are \$16.00 to \$20.00 mostly \$18.00 for 2-ounce containers.

NEW YORK: An unusual warm, dry period early in April produced abundant pollen from maple/willows for use in early brood rearing for colonies coming out of Winter. Full dandelion bloom a signal to reverse hives. This was followed by a much cooler, wetter period, requiring attention to feed for booming or weak colonies. Winter loss was approximately 39% for stationary hives statewide, but 25% of beekeepers experienced no loss of colonies. Many colonies have large areas of drone brood ready to emerge. Swarms have started in eastern and central NY by the end of April. Pollination pallets were in place statewide for the commencement of apple bloom at the end of the April. Honey sales have been brisk for retail in stores and at farmers markets, with prices holding. Many bee clubs are resuming in-person meetings, field sessions, with controlled, limited attendance.

NORTH CAROLINA: Temperatures in North Carolina were slightly above normal for April with a statewide average temperature of 58.7°F, however, a late season frost/freeze occurred on April 21. Precipitation was below normal. Overall statewide soil moisture levels were rated 4 percent very short, 26 percent short, 68.5 percent adequate, and 1.5 percent surplus the week ending May 01. The North Carolina Drought Management Advisory Council reported 45 counties as being abnormally dry.

Food sources were abundant as April gave way to a heavy nectar flow in the southeastern region of the State. However, reports of freeze damage to Holly (including Gallberry), a major nectar and pollen source, remains to be seen. Sumac became an available nectar source across the State. In the Piedmont region Dandelion, Clover (Alsike, Crimson, and Ladino white clover), Blackberry, Tulip Poplar, Black Gum, Black Locust, Vetch, Holly (including Gallberry), and Raspberry began to bloom around mid to late April. Dandelion, Blackberry, Tulip Poplar, Black Gum, Holly, Raspberry, Huckleberry, and Tupelo Gum began blooming in the Coastal Plains region. As a result, bees were able to buildup populations, however, it was noted that some early replacement queens were already failing due to mating issues. Otherwise, colony conditions were reported as fairly good with only some virus issues reported to apiary inspectors.

Commercial pollinator hives were back in North Carolina. Strawberry pollination was active in early April; then hives progressed into blueberries; and by the end of the month began preparing to move up the East Coast to New Jersey, and later Maine, for blueberry and cranberry pollination. Others were preparing hives to move into local cucurbit fields. Some commercial beekeepers were moving hives to areas for honey production.

Retail honey prices at the Raleigh State Farmers' Market were generally unchanged: \$7.00-\$8.00 per 8 ounce jar, \$12.00-\$13.00 per 16 ounce jar, \$20.00-\$22.00 per 32 ounce jar, and \$18.00 per 44 ounce jar; processed honey, creamed, was \$10.00 per 16 ounce jar. Prices at the Piedmont Triad Farmers' Market in Greensboro were also unchanged at: \$8.00-\$12.00 per 8-ounce jar, \$12.00-\$18.00 per 22-ounce jar, and \$20.00 per 32-ounce jar.

NORTH & SOUTH DAKOTA: As April began many bees were working tree fruit bloom in the Pacific Northwest as well other parts of the country. At home soil moisture levels were very short. Some rain fell as the month went on, but soil moisture levels were still low, especially in the North. Water was short. Plantings were underway by mid-April and by the end of the month, plantings in the South were generally ahead of average and near average in the North. More rain is needed.

OHIO: Northwest Ohio: A week of 70's and 80's early in the month turned into 5.5" of snow on April 20th and lows in the mid 20's. Despite the snow, Ohio was dry until the end of April when the lake counties received 1.5" and southwestern Ohio received 2.7" of rain April 27-28. The early warm weather allowed bees to build up and were gathering nectar. Crowded hives decided to prepare to swarm, and swarming started just before the cold spell and resumed afterwards with a few swarms being reported. With the lack of foraging for several days and raising brood, most of the early nectar gathered was consumed during the cold spell. This seems to have put a pause of a couple of weeks before the main swarm season. Spring flowers are blooming along with most of the fruit trees. At the end of April, the red chokeberry and Sargent Crabapple are starting to flower. Overall bees look good. Honey prices remain stable \$5.00 to \$6.00 per pound wholesale and \$8.00 to \$10.00 per pound retail.

West Central Ohio: Adequate rain plus warm weather provided pollen and nectar for good buildup of overwintered colonies. The Winter King Hawthorn and Doublefile Viburnum blooming in Southwestern Ohio. Ohio had above average of colony losses 2020 to 2021. Swarming has started early from managed colonies; feral tree colonies are starting to swarm allowing research to continue on locally adapted honey bees.

OKLAHOMA: During the month of April temperatures were well below normal across most of the state. Precipitation during April was about normal across the state. According to the U.S. Drought Monitor website, normal to a few areas of moderately dry soil conditions exist across the state. Too few prices exist to establish a current market price for wholesale white honey

OREGON: No report issued.

SOUTH CAROLINA: Upstate region of SC reported there was no need to feed colonies as spring bloom was in abundance, however new packages of nucs were fed to assist a strong colony establishment. Brood production continues to increase exponentially causing hive crowding and causing large numbers of swarms.

Colonies have consistent activity with good hive weight. Many colonies were making swarm preparations, causing the beekeeper to step in to prevent colony loss through splitting/dividing of colonies. Overall, colonies are reported to have healthy, active laying queens with good brood patterns.

The SC State Farmers Market located in West Columbia reported Honey prices. 12/1 Pt \$70.00, 12/1 Qt \$130.00, 12 ct. Honey Bears \$50.00-60.00.

TENNESSEE: The honey flow looks like it is going to be a good one this year. Black Locust had an excellent flow during April. Tulip poplar produced well this year. Clover has been blooming heavily producing a lot of nectar.

TEXAS: During the month of April temperatures were slightly below to well below normal across most of the state. Precipitation during April was slightly above normal in East Texas to below average in West Texas. According to the U.S. Drought Monitor website, drought conditions for April were abnormally dry to exceptional drought across most of the state.

Unusually cool temperatures hung on for most of the month. But the wildflower bloom was beautiful. The rain held off until the last day, but it finally came and gave much of West Central Texas a much-needed drink. The mesquite trees finally began to put on leaves and life is back to normal.

Too few prices exist to establish a current market price for wholesale white honey.

WASHINGTON: In early April, temperatures throughout Washington were normal to below normal. Conditions in Central Washington were generally very dry with heavy winds adding to the drying effect. In Yakima County, below freezing temperatures required frost protection in tree fruit orchards. Cold night temperatures caused loss in cherries. By mid-April pears were generally in full bloom, while apricots were in post bloom. Apple orchards were coming on but some only had pollinizers in bloom. In southeast Washington, high winds and inclement weather prevented spring work from happening. Generally, very dry and rain was needed. By the end of the month most bloom was finished, and temperatures had warmed somewhat. Central Washington still needed water. Wildflower sources were expected to be somewhat light this year due to less moisture at lower elevations in Central Washington along the East slopes of the Cascades.

WISCONSIN: Temperatures for the month of April were normal with very little rain. Most beekeepers report their bees are in good condition, while some are rebuilding. Beekeepers report wild foliage for their bees includes Willow and maple pollen, spring ephemerals, forsythia, dandelions, and creeping charley. Cherries are blooming along with apples and pears are just starting. Demand for honey is good at the retail level and fairly good at the wholesale level. Prices are generally unchanged.
